## Ramsey Numbers

For a graph $G$,
$\alpha(G)=$ independence number $=\max \{\#$ independent set $\}$ $\omega(G)=$ clique number $=\max \{\#$ clique $\}=\alpha(\bar{G})$.

$$
\omega\left(C_{5}\right)=\alpha\left(C_{5}\right)=2 .
$$

$\forall G$ with 6 vertices, $\omega(G) \geq 3$ or $\alpha(G) \geq 3$.
These facts can be conveniently described by the Ramsey number:

$$
R(3,3)=6
$$

The smallest number of vertices required to guarantee $\alpha \geq 3$ or $\omega \geq 3$ (precise definition in the next slide).

## Ramsey Numbers and a Generalization

The Ramsey number $R\left(m_{1}, m_{2}\right)$ is defined as:

```
\(R\left(m_{1}, m_{2}\right)\)
    \(=\min \left\{n| | V(G) \mid=n \Longrightarrow \omega(G) \geq m_{1}\right.\) or \(\left.\alpha(G) \geq m_{2}\right\}\)
    \(=\min \left\{n| | V(G) \mid=n \Longrightarrow \omega(G) \geq m_{1}\right.\) or \(\left.\omega(\bar{G}) \geq m_{2}\right\}\)
    \(=\min \left\{n| | V(G) \mid=n \Longrightarrow \alpha(\bar{G}) \geq m_{1}\right.\) or \(\left.\alpha(G) \geq m_{2}\right\}\)
```

A graph with $n$ vertices defines a partition of $\boldsymbol{E}\left(\boldsymbol{K}_{n}\right)$ into 2 parts, "edges" and "non-edges".

Generalized Ramsey numbers $R\left(m_{1}, m_{2}, \ldots, m_{k}\right)$ can be defined if we consider partitions of $\boldsymbol{E}\left(\boldsymbol{K}_{n}\right)$ into $k$ parts, i.e., edge-colorings.

Let $[n]=\{1,2, \ldots, n\}$, and $E\left(K_{n}\right)=\binom{[n]}{2}$. The set of $k$-edge-coloring of $\boldsymbol{K}_{n}$ is denoted by $C(n, k)$ :

$$
C(n, k)=\left\{f \mid f: E\left(K_{n}\right) \rightarrow[k]\right\} .
$$

We abbreviate

$$
\begin{aligned}
& \omega_{i}(f)=\omega\left([n], f^{-1}(i)\right), \quad \alpha_{i}(f)=\alpha\left([n], f^{-1}(i)\right) . \\
& R\left(m_{1}, \ldots, m_{k}\right) \\
& =\min \left\{n \mid \forall f \in C(n, k), \exists i \in[k], \omega_{i}(f) \geq m_{i}\right\} \\
& \bar{R}\left(m_{1}, \ldots, m_{k}\right) \\
& =\min \left\{n \mid \forall f \in C(n, k), \exists i \in[k], \alpha_{i}(f) \geq m_{i}\right\}
\end{aligned}
$$

The last one is called the complemtary Ramsey number.

$$
\bar{R}\left(m_{1}, m_{2}\right)=R\left(m_{2}, m_{1}\right)=R\left(m_{1}, m_{2}\right) .
$$

So we focus on the case $k \geq 3$. Also we assume $m_{i} \geq 3$.

## History

- We submitted to our work to a conference proceedings, and received positive reviews, in 2013.
- We uploaded our paper arXiv:1406.2050.
- David Conlon notified to us, that the concept was introduced already by Erdős-Hajnal-Rado (1965), some results were proved by Erdős-Szemerédi (1972).
- Chung-Liu (1978), " $d$-chromatic Ramsey numbers",
$\bar{R}\left(m_{1}, \ldots, m_{k}\right)=R_{k-1}^{k}\left(K_{m_{1}}, \ldots, K_{m_{k}}\right)$. $\bar{R}(4,4,4)=10$.
- Harborth-Moller (1999), "weakened Ramsey numbers", $\bar{R}(m, \ldots, m)=R_{k-1}^{k}\left(K_{m}\right)$.
- Xu-Shao-Su-Li (2009), "multigraph Ramsey numbers",

$$
\bar{R}\left(m_{1}, \ldots, m_{k}\right)=f^{(k-1)}\left(m_{1}, \ldots, m_{k}\right) . \bar{R}(5,5,5) \geq 20
$$

## Geometric Application

Given a metric space ( $\boldsymbol{X}, \boldsymbol{d}$ ) and a positive integer $k$, classify subsets $\boldsymbol{Y}$ of $\boldsymbol{X}$ with the largest size subject to

$$
|\{d(x, y) \mid x, y \in Y, x \neq y\}| \leq k .
$$

For example, $\boldsymbol{X}=\mathbb{R}^{n}, \boldsymbol{k}=1 \Longrightarrow$ regular simplex.
The method is by induction on $k$.
The distance function $\boldsymbol{d}$ defines a $k$-edge-coloring of the complete graph on $\boldsymbol{Y}$.

If

$$
\bar{R}(\underbrace{m, m, \ldots, m}_{k}) \leq|Y|
$$

then $\boldsymbol{Y}$ must contain an $m$-subset having only $(k-1)$ distances (so we can expect to use already obtained results for $k-1$ ).

## Einhorn and Schoenberg (1966)

## Conjecture

The vertices of the regular icosahedron is the only 12 -point 3 -distance set in $\mathbb{R}^{3}$.

- Claimed to be proven by Shinohara, arXiv:1309.2047.
- It would simplify the proof if we had $\bar{R}(5,5,5)=12$, but this was not the case.
- Xu-Shao-Su-Li (2009), $\bar{R}(5,5,5) \geq 20$.
- What is $\bar{R}(5,5,5)$ ? It should be easier than determining $\bar{R}(5,5)=\boldsymbol{R}(5,5)$, which is known to satisfy

$$
43 \leq R(5,5) \leq 48
$$

In fact,
$R(m, m)=\bar{R}(m, m) \geq \bar{R}(m, m, m) \geq \bar{R}(m, m, m, m) \cdots$.

## $\bar{R}(3,3,3)=5$ by factorization

- $\boldsymbol{K}_{4}$ has a 3 -edge-coloring $f$ into $2 \boldsymbol{K}_{2}$ (a 1-factorization). Then $\alpha_{i}(f)=2$ for $i=1,2,3$. This implies

$$
\bar{R}(3,3,3)>4 .
$$

The argument can be generalized to give:

## Theorem

If $\boldsymbol{K}_{m n}$ is factorable into $k$ copies of $n \boldsymbol{K}_{\boldsymbol{m}}$, then $\bar{R}(\underbrace{n+1, \ldots, n+1}_{k})=m n+1$.

Setting $m=n=2$ and $k=3$, we obtain $\bar{R}(3,3,3)=5$.

## Factorizations

## Theorem

If $\boldsymbol{K}_{m n}$ is factorable into $k$ copies of $n \boldsymbol{K}_{\boldsymbol{m}}$, then
$\bar{R}(\underbrace{n+1, \ldots, n+1}_{k})=m n+1$.

- Setting $m=3, n=2 t+1, k=3 t+1$, the existence of a Kirkman triple system in $\boldsymbol{K}_{3 n}$ implies

$$
\bar{R}(\underbrace{2 t+2, \ldots, 2 t+2}_{3 t+1})=6 t+4 .
$$

- Harborth-Möller (1999): Setting $m=n, k=n+1$, if $n-1$ MOLS of order $n$ exist, then

$$
\bar{R}(\underbrace{n+1, \ldots, n+1}_{n+1})=n^{2}+1 .
$$

The converse of the last statement also holds.

## Ramsey $(s, t)$-graph

A graph $G$ is said to be a Ramsey $(s, t)$-graph if

$$
\omega(G)<s \text { and } \alpha(G)<t .
$$

We write $\boldsymbol{G} \subset \boldsymbol{H}$ if $\boldsymbol{H}$ is an edge-subgraph of $\boldsymbol{G}$, and write $(V(G), E(G) \backslash E(H))=\boldsymbol{G}-\boldsymbol{H}$.

## Theorem

For $m_{1}, m_{2}, m_{3}, n \geq 2$, the following are equivalent.
(i) $\bar{R}\left(m_{1}, m_{2}, m_{3}\right) \leq n$,
(ii) for any two Ramsey ( $\boldsymbol{m}_{1}, \boldsymbol{m}_{2}$ )-graphs $\boldsymbol{G}$ and $\boldsymbol{H}$ on the vertex set $[\boldsymbol{n}]$ such that $\boldsymbol{G} \supset \boldsymbol{H}$, one has $\boldsymbol{\alpha}(\boldsymbol{G}-\boldsymbol{H}) \geq \boldsymbol{m}_{3}$.

## Small complementary Ramsey numbers

Chung-Liu (1978):

| $\boldsymbol{k}$ | 3 | 4 | 5 | 6 | 7 | 8 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\overline{\boldsymbol{R}}(\boldsymbol{k}, 3,3)$ | 5 | 5 | 5 | 6 | $\cdots$ | $\cdots$ |
| $\overline{\boldsymbol{R}}(\boldsymbol{k}, 4,3)$ | 5 | 7 | 8 | 8 | 9 | $\cdots$ |
| $\overline{\boldsymbol{R}}(\boldsymbol{k}, \mathbf{5}, \boldsymbol{3})$ | 5 | 8 | 9 | 11 | 12 | 12 |

and

$$
\bar{R}(k, 5,3)= \begin{cases}13 & \text { if } 9 \leq k \leq 13 \\ 14 & \text { if } k \geq 14\end{cases}
$$

## Small complementary Ramsey numbers

We abbreviate

$$
\bar{R}(m ; k)=\bar{R}(\underbrace{m, \ldots, m}_{k}) .
$$

| $\boldsymbol{k}$ | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | $11 \cdots 15$ | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\overline{\boldsymbol{R}}(\mathbf{3} ; \boldsymbol{k})$ | 5 | 3 | $\cdots$ |  |  |  |  |  |  |  |
| $\overline{\boldsymbol{R}}(\mathbf{4} \boldsymbol{;})$ | 10 | 10 | 7 | 5 | 4 | $\cdots$ |  |  |  |  |
| $\overline{\boldsymbol{R}}(\mathbf{5} ; \boldsymbol{k})$ | $?$ | $?$ | 17 | 10 | 9 | 6 | 6 | 6 | $5 \cdots$ |  |
| $\overline{\boldsymbol{R}}(\mathbf{6} ; \boldsymbol{k})$ | $?$ | $?$ | $?$ | 26 | 16 | 11 | 11 | 8 | $7 \cdots 7$ | 6 |

Thank you very much for your attention!
